## Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 28,36,37 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lynch [US 5,586,338] in view of Barber [US 6,405,038].

Regarding claims 28,36,37 Lynch discloses a method for determining whether a particular service is provided by a cellular provider comprising:

- -Reading a first identification number (SID) broadcast in a first frequency band where the first SID identifies a cellular service provider (see abstract, col.8, lines 5-14);
- -Determining whether the first SID matches a SID stored in a SID table (see col.8, lines 27-29 and lines 48-54);
- -Switching to a second frequency and reading a second SID broadcast in the second frequency if the first SID does not match a SID stored in the SID table (see col.9, lines 26-39, Fig.5);
- -wherein the support for the particular cellular service is identified if the SID in the first or second frequency bands matches a SID stored in the SID table (see col.2, lines 23-32), the first and second frequency bands being cellular bands A and B (see col.8, lines 5-9).

Lynch, however, is silent to teach if low priority detection is sufficient and performing high priority detection process if low priority is determined to be insufficient.

However Barber teaches a method of determining whether support for the particular service needs to be detected quickly if neither the first or second SID is identified in the said

table and performing first detection (high priority) process if support for the particular service needs to be detected quickly and performing a second detection (low priority) process if support for the particular service does not need to be detected quickly. See summary of invention, col. 5, line 15 – col. 6, line 4. Here Barber teaches a method where different priority levels can be detected and also with each lower priority level detected, SIDs of preceding higher priority level is not detected. However in case of emergency situation (see col. 2, lines 49-67), services are provided if any SID that are not on the preferred list is received by the cell phone meaning if low priority is determined not sufficient the preceding high priority SID is used.

Therefore it would have been obvious to one with ordinary skill in the art at the time the invention was made to provide the above teaching of Barber to Lynch so that the 911 emergency calls can be placed within areas where a new system selected is not available or if a new system is available and not listed on the SID list.

3. Claims 29,30,38 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lynch [US 5,586,338] and Barber [US 6,405,038] in view of Evans [US 6,311,060] and further in view of Roach [US 6,044,265].

Regarding claim 29, Lynch and Barber as treated in claim 28 do not disclose a method of listening for cellular pages having an NPA value in a first frequency band, the NPA value indicating that the cellular provider broadcasting in the first frequency band supports the particular cellular service.

Evans teaches that a control message is referred to as a page and SID is carried in the control channel (see col.2, lines 1-44).

Roach teaches a method of identifying the system identification (SID) by a NPA. Roach further teaches the method of updating the SID table after a page is sensed in the said frequency block. See column 4, lines 13-44.

It is apparent that Evans and Roach teach that listening for cellular pages having an NPA value in a first frequency band, the NPA value indicating that the cellular provider broadcasting in the first frequency band supports the cellular service.

Therefore it would have been obvious to one with ordinary skill in the art at the time the invention was made to provide the above teachings of Roach and Evans to Barber and Lynch in order for an easy updating SID and informing the cellular set to add or remove the SIDs to the list.

Regarding claim 30, Lynch and Barber and Evans teach a method for determining whether a particular service supported by a cellular service provider comprising all the limitations as claimed. Evans further teaches if the cellular page is not detected in the first frequency band within a period of time, switching to a second frequency band (See Fig.9). Evans and Roach further teach that listening for cellular pages having an NPA value in a first frequency band, the NPA value indicating that the cellular provider broadcasting in the first frequency band supports the particular cellular service (See explanation treating claim 29).

Therefore it would have been obvious to one with ordinary skill in the art at the time the invention was made to provide the above teachings of Roach and Evans to Barber and Lynch in order for an easy updating SID and informing the cellular set to add or remove the SIDs to the list.

Application/Control Number: 09/549,450

Art Unit: 2684

Regarding claim 38, Lynch and Barber as treated in claim 28 do not disclose a method of listening for cellular pages having an NPA value in a first frequency band, the NPA value indicating that the cellular provider broadcasting in the first frequency band supports the particular cellular service.

Evans teaches that a control message is referred to as a page and SID is carried in the control channel (see col.2, lines 1-44).

Roach teaches a method of identifying the system identification (SID) by a NPA. Roach further teaches the method of updating the SID table after a page is sensed in the said frequency block. See column 4, lines 13-44.

It is apparent that Evans and Roach teach that listening for cellular pages having an NPA value in a first frequency band, the NPA value indicating that the cellular provider broadcasting in the first frequency band supports the cellular service.

Therefore it would have been obvious to one with ordinary skill in the art at the time the invention was made to provide the above teachings of Roach and Evans to Barber and Lynch in order for an easy updating SID and informing the cellular set to add or remove the SIDs to the list.

Evans further teaches if the cellular page is not detected in the first frequency band within a period of time, switching to a second frequency band (See Fig.9). Evans and Roach further teach that listening for cellular pages having an NPA value in a first frequency band, the NPA value indicating that the cellular provider broadcasting in the first frequency band supports the cellular service (See explanation treating claim 29).

Application/Control Number: 09/549,450

Art Unit: 2684

Therefore it would have been obvious to one with ordinary skill in the art at the time the invention was made to provide the above teachings of Roach and Evans to Barber and Lynch in order for an easy updating SID and informing the cellular set to add or remove the SIDs to the list.

4. Claims 31-34,39-42 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lynch [US 5,586,338] and Barber [US 6,405,038] in view of Zicker [US 5,159,625] and further in view of Evans [US 6,311,060].

Regarding claims 31,39, Lynch and Barber as treated in claim 28 teach all the limitations as claimed. They are however silent to teach transmitting a page request packet in the first frequency band to a host across a cellular network and receiving a cellular page from the host in response to the page request packet thereby identifying the cellular service provider broadcasting at the first frequency band as one which supports the particular cellular service.

However, Zicker teach the exchange of data between host and a remotely programmable cellular mobile radiotelephone (CMR) (see col.5, lines 5-20 and Fig.1).

Evans teach transmitting and receiving a message/page in the first frequency band between the MSC and the home system and the message indicates that the particular CMR has registered in another cellular system and includes the SID and MSC number identifying the foreign CMR system (see col.2, lines 1-44, col.11, lines 3-27, 55-67 and col.12, lines 1-3). It is apparent that Lynch, Barber, Zicker and Evans teach transmitting and receiving a message in the first frequency band to a host across a cellular network.

Application/Control Number: 09/549,450

Art Unit: 2684

Therefore it would have been obvious to one with ordinary skill in the art at the time the invention was made to provide the above teachings of Evans to modified Barber and Lynch in order to collect billing information and bill the customer for using the home or foreign system.

Regarding claims 32,40, Lynch, Barber, Zicker and Evans as treated in claim 31 teach all the limitations as claimed. Evans further teaches updating the SID table to include a SID of the cellular service provider from which the cellular page was received (see col.11, lines 4-27 and Fig.9).

Therefore it would have been obvious to one with ordinary skill in the art at the time the invention was made to provide the above teachings of Evans to modified Barber and Lynch in order to facilitate roaming of the user to foreign system.

Regarding claims 33,41, Lynch and Barber as treated in claim 31 teach all the limitations as claimed. Evans further teach if the cellular page is not received within a pre-determined time, switching to a second frequency band and transmitting a second page request to a host across a cellular network, and receiving in response a cellular page from the host, thereby identifying the cellular service provider broadcasting at the second frequency band as one which supports the particular cellular service (see Fig.9).

Therefore it would have been obvious to one with ordinary skill in the art at the time the invention was made to provide the above teachings of Evans to modified Barber and Lynch in order to collect billing information and bill the customer for using the home or foreign system.

Application/Control Number: 09/549,450 Page 8

Art Unit: 2684

Regarding claims 34,42 Lynch and Barber as treated in claim 33 teach all the limitations as claimed. Evans further teaches updating the SID table to include a SID of the cellular service provider from which the cellular page was received (see col.11, lines 4-27 and Fig.9).

Therefore it would have been obvious to one with ordinary skill in the art at the time the invention was made to provide the above teachings of Evans to modified Barber and Lynch in order to facilitate roaming of the user to foreign system.

## Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Sujatha Sharma whose telephone number is 571-272-7886. The examiner can normally be reached on Mon-Fri 7.30am - 4.00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nay Maung can be reached on 571-272-7882. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
